STAT 453: Introduction to Deep Learning and Generative Models

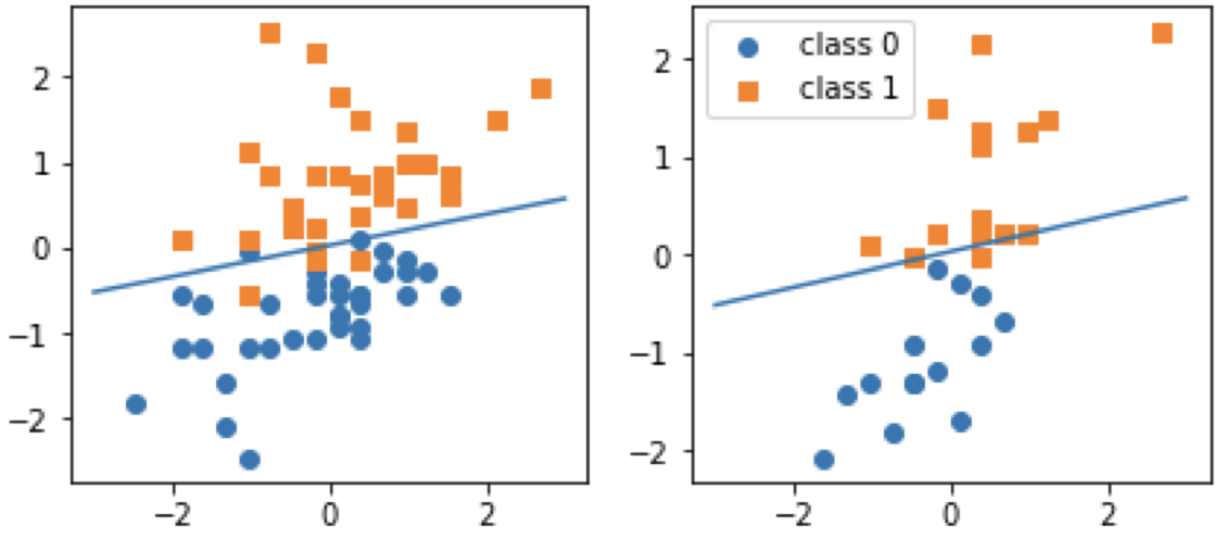
Ben Lengerich

Lecture 08: (Multinomial) Logistic Regression

September 29, 2025

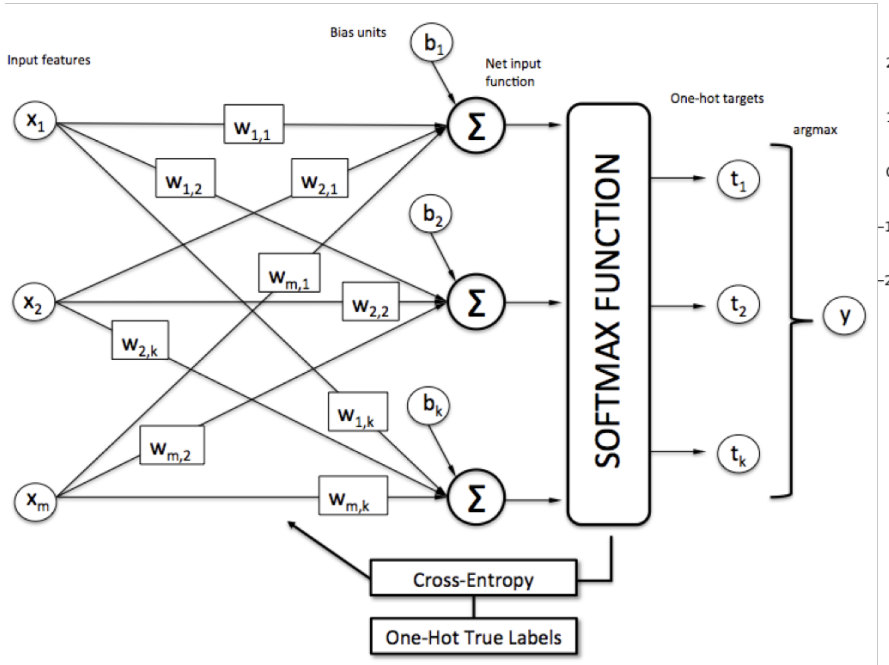
Recall

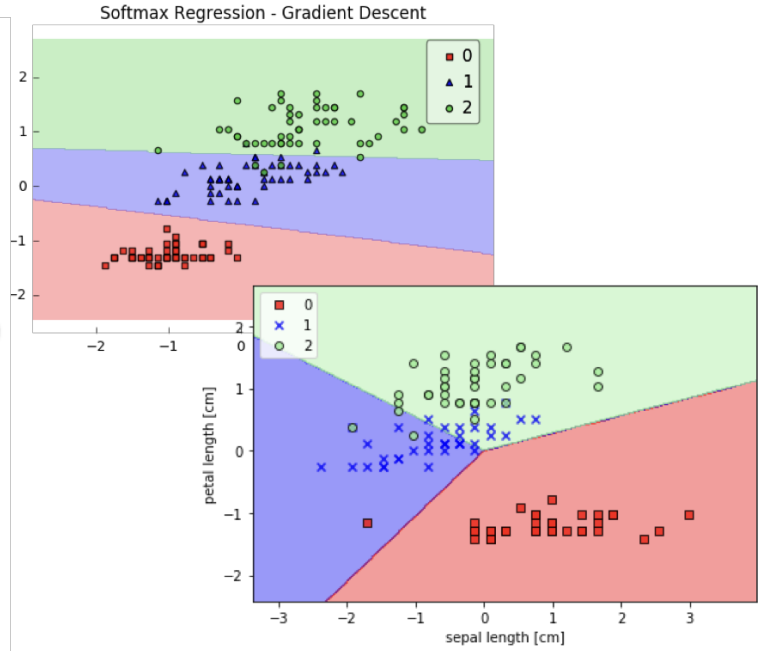
1. Perceptron learning algorithm → gradient descent as a general algorithm
2. Conceptualized gradient descent via computation graphs
3. How to write code in PyTorch to train basic neural nets



Today: Our old friend logistic regression…

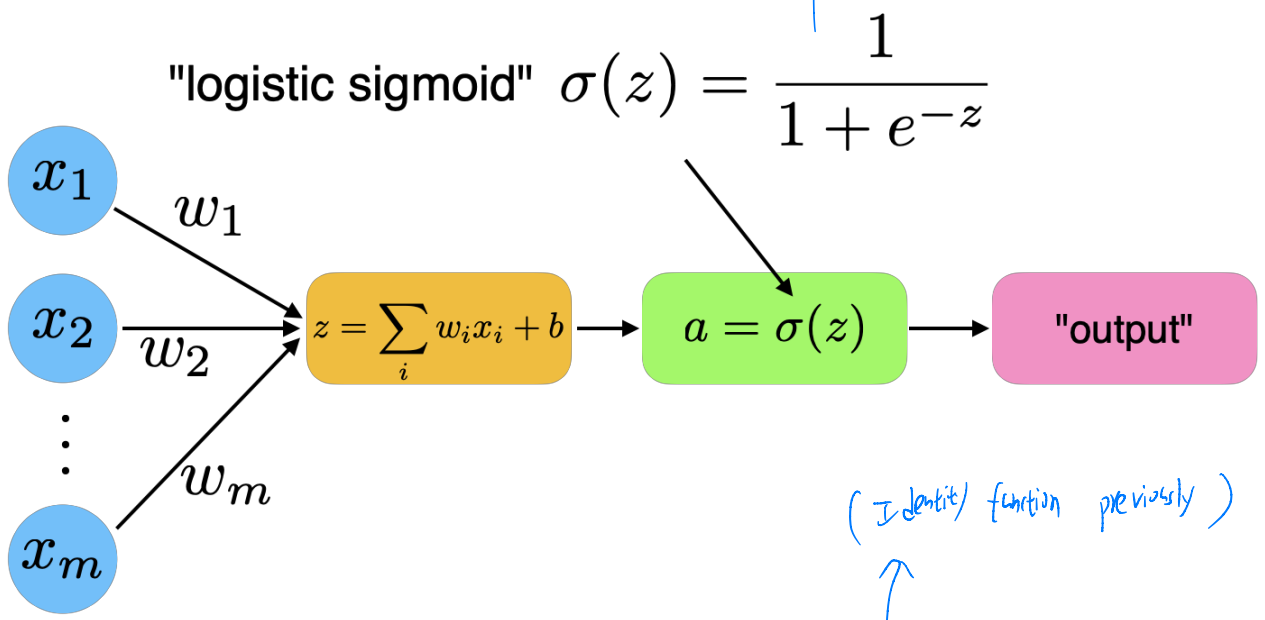
1. A better loss function for classification (cross entropy instead of MSE)
2. Extending neurons to multi-classification (multiple output nodes + softmax)





Logistic Regression Neuron

- For binary classes $y \in \{0, 1\}$

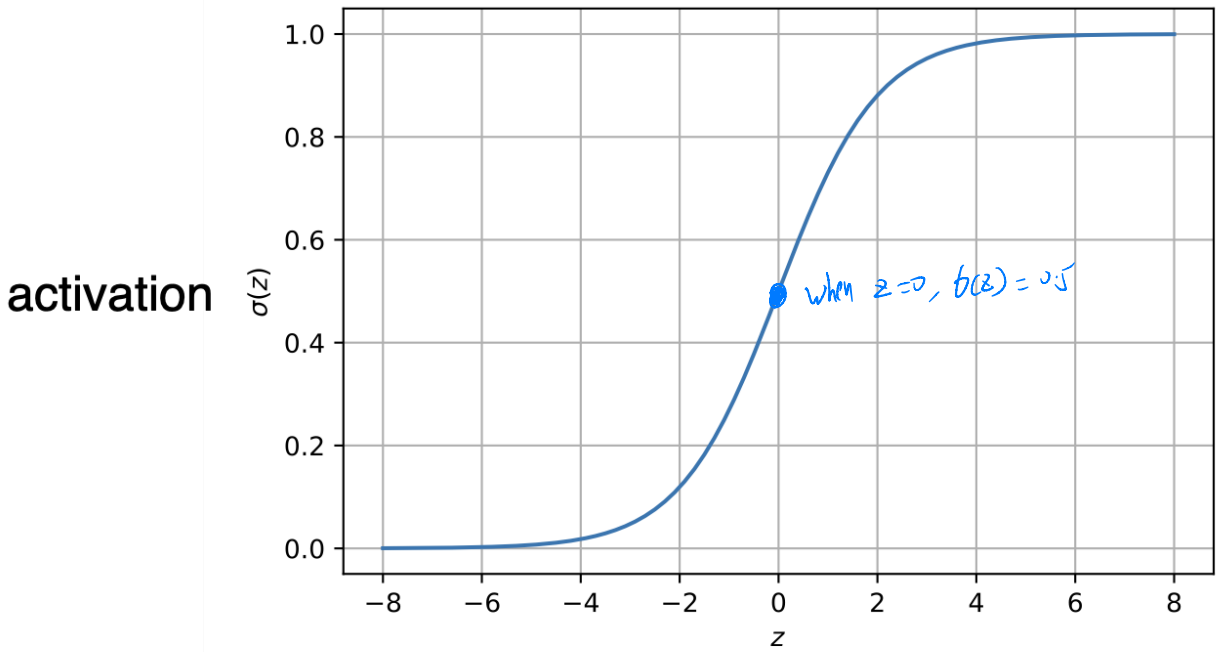


- In ADALINE, the activation function was identity function: $\sigma(z) = z$
- ADALINE we used MSE as loss function: $MSE = \frac{1}{n}\sum_i \left(a^{[i]} - y^{[i]}\right)^2$
- We'll use a different loss function for logistic regression

The building block: Logistic Sigmoid Function

$$\sigma(z) = \frac{e^z}{1+e^z} = \frac{1}{1+e^{-z}}$$

A type of activation function



Logistic Regression

- Given the output:

the actual output after activation

z from before

$$h(\mathbf{x}) = \sigma(\mathbf{w}^\top \mathbf{x} + b)$$

- We compute the probability as

This is just $P(y=1 \mid x) = h(x)$

$$P(y|\mathbf{x}) = \begin{cases} h(\mathbf{x}) & \text{if } y = 1 \\ 1 - h(\mathbf{x}) & \text{if } y = 0 \end{cases}$$

Can we write this more compactly?

Today: Our old friend logistic regression…

1. Logistic regression as an artificial neuron
2. **Negative log-likelihood loss**
3. Logistic Regression Learning Rule
4. Logits and Cross-Entropy
5. Logistic Regression Code Example
6. Generalizing to Multiple Classes: Softmax Regression
7. One-Hot Encoding and Multi-category Cross-Entropy
8. Softmax Regression Learning Rule
9. Softmax Regression Code Example

Logistic Regression

- Given the output:

$$h(\mathbf{x}) = \sigma(\mathbf{w}^\top \mathbf{x} + b)$$

- We compute the probability as

$$P(y|\mathbf{x}) = \begin{cases} h(\mathbf{x}) & \text{if } y = 1 \\ 1 - h(\mathbf{x}) & \text{if } y = 0 \end{cases}$$

$$P(y|\mathbf{x}) = a^y (1-a)^{(1-y)}$$

Here a is the activation $= h(x)$

Recall Bernoulli distribution…

Logistic Regression: Estimation

- Given the probability:

$$P(y|\mathbf{x}) = a^y(1-a)^{(1-y)}$$

- Under MLE estimation, we would like to maximize the multi-sample likelihood:

$$P\left(y^{[i]}, \ldots, y^{[n]}|\mathbf{x}^{[1]}, \ldots, \mathbf{x}^{[n]}\right) = \prod_{i=1}^{n} P\left(y^{[i]}|\mathbf{x}^{[i]}\right)$$

(Assumption: all training data are distributed independently)

(And we want to maximize the probability!)

Logistic Regression: Estimation

- Given the probability:

$$P(y|\mathbf{x}) = a^y(1-a)^{(1-y)}$$

- Under MLE estimation, we would like to maximize the multi-sample likelihood:

$$P\left(y^{[i]},\ldots,y^{[n]}|\mathbf{x}^{[1]},\ldots,\mathbf{x}^{[n]}\right) = \prod_{i=1}^{n} P\left(y^{[i]}|\mathbf{x}^{[i]}\right)$$

Suppose this were linear regression: $h(x) = \boldsymbol{w}^T\boldsymbol{x} + b$

$$L(\boldsymbol{w}, b; \boldsymbol{X}, \boldsymbol{y}) = \prod_i N\left(y^{[i]} \mid h\left(x^{[i]}\right)\right)$$

Assume y is based on prediction $h(x)$ + noise. That's why $y \propto$ Normal distribution as $h(x)$ being mean

(Under (w,b), the i's sample's label $y^{[i]}$'s probability:

$$L(\boldsymbol{w}, b; \boldsymbol{X}, \boldsymbol{y}) \propto -\prod_i \left(y^{[i]} - h\left(x^{[i]}\right)\right)^2$$

Maximize the L → make the model as accurate as we can)

$$\ell(\boldsymbol{w}, b; \boldsymbol{X}, \boldsymbol{y}) \propto -\sum_i \left(y^{[i]} - h\left(x^{[i]}\right)\right)^2$$

$$\Rightarrow \quad \hat{\boldsymbol{w}}_{MLE}, \hat{b}_{MLE} = \operatorname{argmin} \sum_i \left(y^{[i]} - h\left(x^{[i]}\right)\right)^2$$

Logistic Regression: Estimation

- Given the probability:

$$P(y|\mathbf{x}) = a^y(1-a)^{(1-y)}$$

- Under MLE estimation, we would like to maximize the multi-sample likelihood:

$$P\left(y^{[i]},\ldots,y^{[n]}|\mathbf{x}^{[1]},\ldots,\mathbf{x}^{[n]}\right) = \prod_{i=1}^{n} P\left(y^{[i]}|\mathbf{x}^{[i]}\right)$$

$$= \prod_{i=1}^{n} \left(\sigma\left(z^{(i)}\right)\right)^{y^{(i)}} \left(1-\sigma\left(z^{(i)}\right)\right)^{1-y^{(i)}}$$

$y^{(i)}$: The the label (0/1)

$\sigma(z^{(i)})$: ($a^{(i)}$, the output of ij sample)

Likelihood

Logistic Regression: Estimation

$$P\left(y^{[i]}, \ldots, y^{[n]} | \mathbf{x}^{[1]}, \ldots, \mathbf{x}^{[n]}\right) = \underbrace{\prod_{i=1}^{n} \left(\sigma\left(z^{(i)}\right)\right)^{y^{(i)}} \left(1 - \sigma\left(z^{(i)}\right)\right)^{1-y^{(i)}}}_{\text{Likelihood}}$$

(Long multiplication, if the sample size is too large, the result will be extremely small, computer can lose the information and just treat it as 0)

- We are going to optimize via gradient descent, so let's apply the logarithm to separate components:

$$l(\mathbf{w}) = \log L(\mathbf{w}) \quad \text{(Turn multiplication into sums)}$$

$$= \underbrace{\sum_{i=1}^{n} \left[y^{(i)} \log\left(\sigma\left(z^{(i)}\right)\right) + \left(1 - y^{(i)}\right) \log\left(1 - \sigma\left(z^{(i)}\right)\right)\right]}_{\text{Log-Likelihood}}$$

(推导在此省略)

$y^{(i)} = 1 \rightarrow \log\left(\sigma(z^{(i)})\right)$

$y^{(i)} = 0 \rightarrow \log\left(1 - \sigma(z^{(i)})\right)$

Negative Log-Likelihood (NLL) Loss

$$l(\mathbf{w}) = \log L(\mathbf{w})$$

$$= \underbrace{\sum_{i=1}^{n} \left[y^{(i)} \log \left(\sigma\left(z^{(i)}\right) \right) + \left(1 - y^{(i)}\right) \log \left(1 - \sigma\left(z^{(i)}\right)\right) \right]}_{\text{Log-Likelihood}}$$

- In practice, we often **minimize negative log-likelihood** instead of **maximizing log-likelihood**:

$$\underbrace{\hat{\boldsymbol{w}} = \operatorname{argmin} - l(\boldsymbol{w})}_{\text{Log-Likelihood}}$$

Today: Our old friend logistic regression…

1. Logistic regression as an artificial neuron
2. Negative log-likelihood loss
3. **Logistic Regression Learning Rule**
4. Logits and Cross-Entropy
5. Logistic Regression Code Example
6. Generalizing to Multiple Classes: Softmax Regression
7. One-Hot Encoding and Multi-category Cross-Entropy
8. Softmax Regression Learning Rule
9. Softmax Regression Code Example

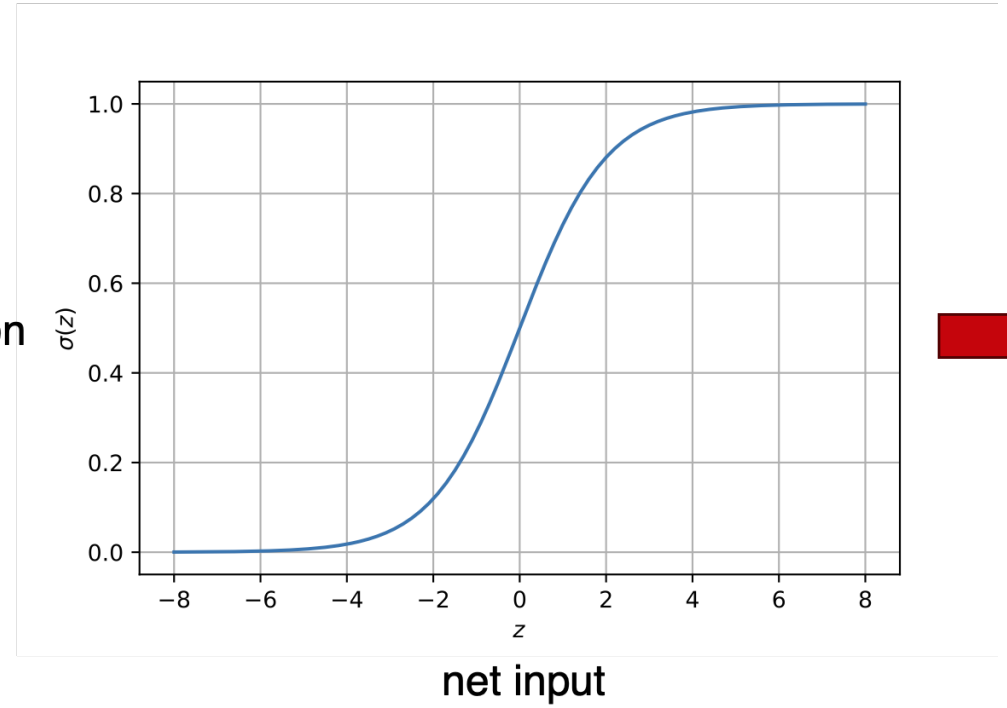
The building block: Logistic Sigmoid Function

A nice property: Derivatives of the sigmoid function are nice to us

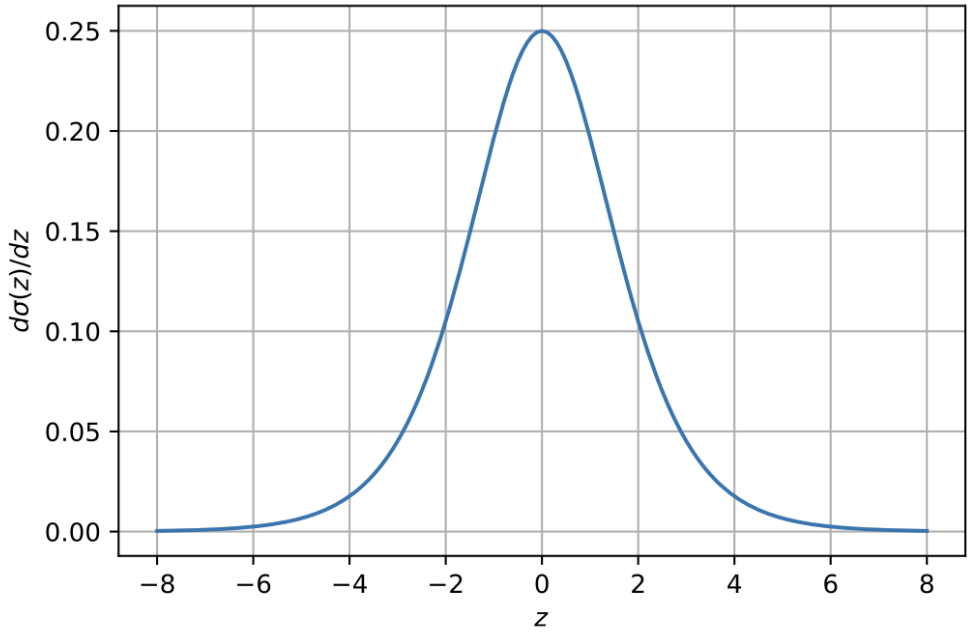
$$\sigma(z) = \frac{e^z}{1+e^z} = \frac{1}{1+e^{-z}}$$

$$\frac{d}{dz}\sigma(z) = \frac{e^{-z}}{(1+e^{-z})^2} = \sigma(z)(1-\sigma(z))$$

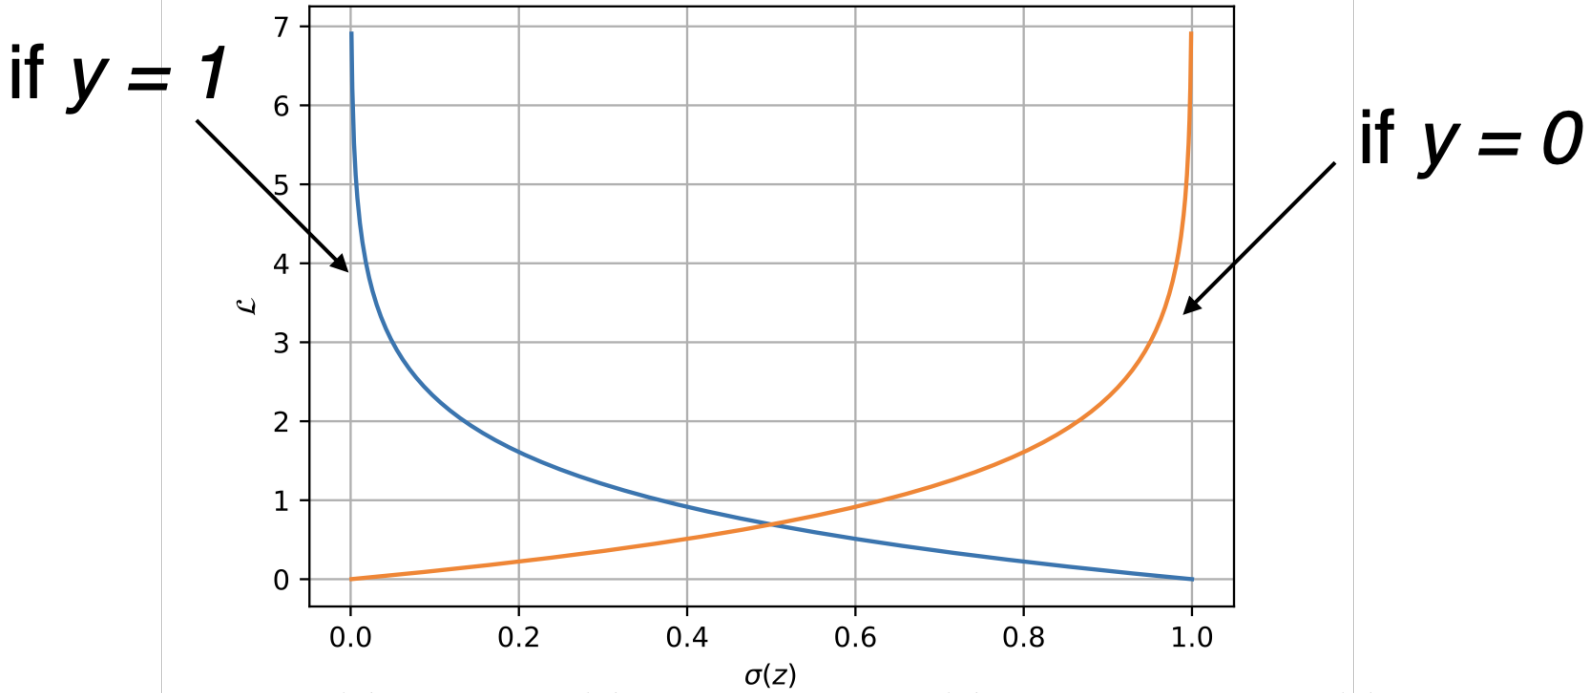
activation



net input



Logistic Regression: Loss for a Single Training Example



$$\mathcal{L}(\mathbf{w}) = -\left(y^{(i)} \log\left(\hat{y}^{(i)}\right) + \left(1 - y^{(i)}\right) \log\left(1 - \hat{y}^{(i)}\right)\right)$$

$$\mathcal{L}(\mathbf{w}) = -y^{(i)} \log\left(\sigma\left(z^{(i)}\right)\right) + \left(1 - y^{(i)}\right) \log\left(1 - \sigma\left(z^{(i)}\right)\right)$$

Logistic Regression: Learning Rule

Same gradient descent rule as before:

$$\frac{\partial \mathcal{L}}{\partial w_j} = \frac{\partial \mathcal{L}}{\partial a}\frac{da}{dz}\frac{\partial z}{\partial w_j}$$

$$\frac{\partial \mathcal{L}}{\partial a} = \frac{a-y}{a-a^2}$$

$$\frac{da}{dz} = \frac{e^{-z}}{(1+e^{-z})^2} = a \cdot (1-a)$$

$$\frac{\partial z}{w_j} = x_j$$

$$\frac{\partial \mathcal{L}}{\partial z} = a - y$$

$$\frac{\partial \mathcal{L}}{\partial w_j} = (a-y)x_j$$

Logistic Regression: Learning Rule

Stochastic gradient descent:

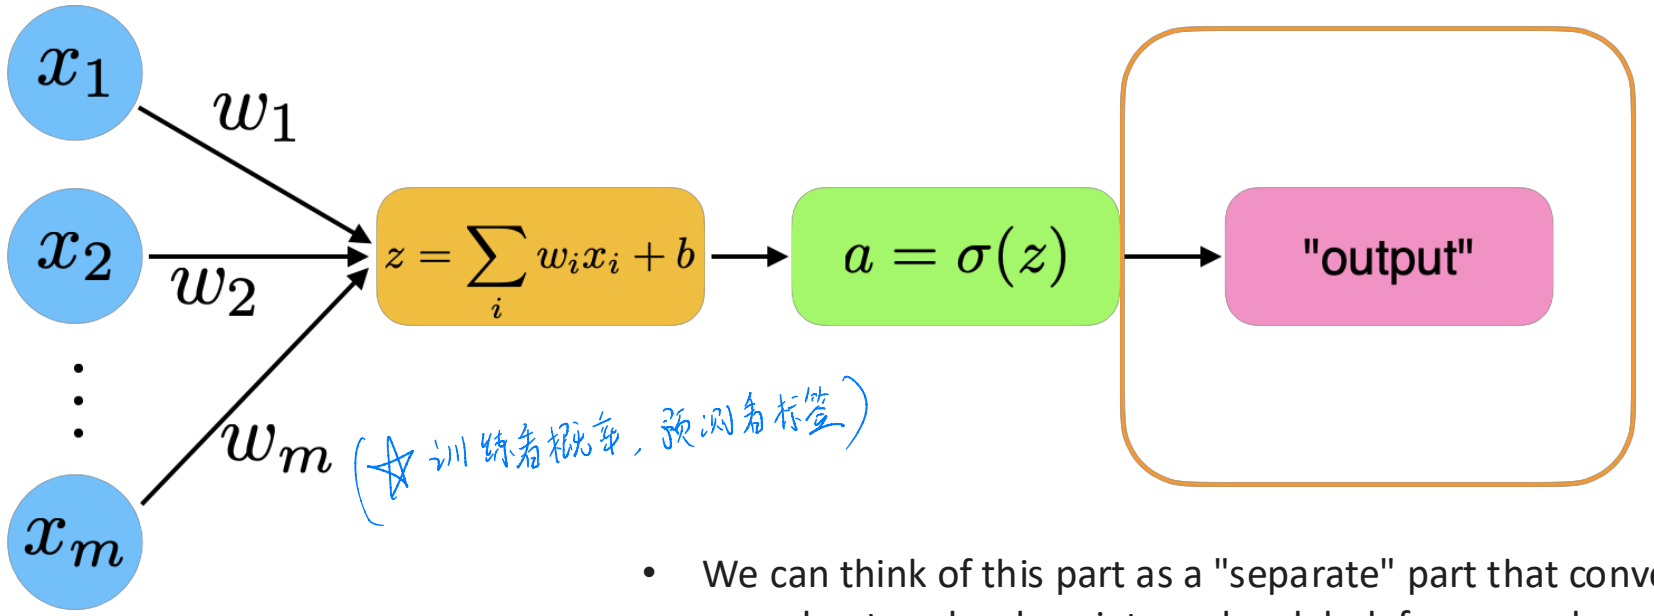
1. Initialize $\mathbf{w} := \mathbf{0} \in \mathbb{R}^m$, $\mathbf{b} := 0$
2. For every training epoch:
   - A. For every $\langle \mathbf{x}^{[i]}, y^{[i]} \rangle \in \mathcal{D}$
     - (a) $\hat{y}^{[i]} := \sigma\left(\mathbf{x}^{[i]T}\mathbf{w} + b\right)$ → Forward pass first
     - (b) $\nabla_{\mathbf{w}}\mathcal{L} = -\left(y^{[i]} - \hat{y}^{[i]}\right)\mathbf{x}^{[i]}$
       $\nabla_b\mathcal{L} = -\left(y^{[i]} - \hat{y}^{[i]}\right)$ → 2 gradients
     - (c) $\mathbf{w} := \mathbf{w} + \eta \times \left(-\nabla_{\mathbf{w}}\mathcal{L}\right)$
       $b := b + \eta \times \underbrace{\left(-\nabla_b\mathcal{L}\right)}_{\text{negative gradient}}$

learning rate

Note

$$a - y \Leftrightarrow -\left(y^{[i]} - \hat{y}^{[i]}\right)$$

Logistic Regression: Predicting Labels vs Probabilities



In logistic regression, we can use

$$\hat{y} := \begin{cases} 1 & \text{if } \sigma(z) > 0.5 \\ 0 & \text{otherwise} \end{cases}$$

which is the same as

$$\hat{y} := \begin{cases} 1 & \text{if } z > 0.0 \\ 0 & \text{otherwise} \end{cases}$$

- We can think of this part as a "separate" part that converts the neural network values into a class label, for example; e.g., via a threshold function
- **Predicted class labels are not used during training** (except by the Perceptron)
- ADALINE, Logistic Regression, and all common types of multi-layer neural networks don't use predicted class labels directly for optimization as a threshold function is not smooth

Today: Our old friend logistic regression…

1. Logistic regression as an artificial neuron
2. Negative log-likelihood loss
3. Logistic Regression Learning Rule
4. **Logits and Cross-Entropy**
5. Logistic Regression Code Example
6. Generalizing to Multiple Classes: Softmax Regression
7. One-Hot Encoding and Multi-category Cross-Entropy
8. Softmax Regression Learning Rule
9. Softmax Regression Code Example

About the term “Logits”

- “Logits” = “log-odds unit”: $\text{logit}(p) = \log\left(\frac{p}{1-p}\right)$
- “Logits” is very common DL jargon
  - Typically means the net input of the last neuron layer
- In logistic regression, the “logits” are: $\boldsymbol{w}^T\boldsymbol{x}$

$= z =$ logits

About the term “Binary Cross Entropy”

- *Negative log-likelihood* and *binary cross entropy* are equivalent
- They are just formulated in different contexts
- Cross entropy comes from the "information theory" perspective

$$H_{\mathbf{a}}(\mathbf{y}) = -\sum_{i} \left(y^{[i]} \log(a^{[i]}) + (1 - y^{[i]}) \log(1 - a^{[i]}) \right)$$

Binary Cross Entropy

This assumes one-hot encoding where the y's are either 0 or 1

$$H_{\mathbf{a}}(\mathbf{y}) = \sum_{i=1}^{n} \sum_{k=1}^{K} -y_k^{[i]} \log \left(a_k^{[i]} \right)$$

(Multi-category) Cross Entropy

for K different class labels

Today: Our old friend logistic regression…

8. Softmax Regression Learning Rule
9. Softmax Regression Code Example

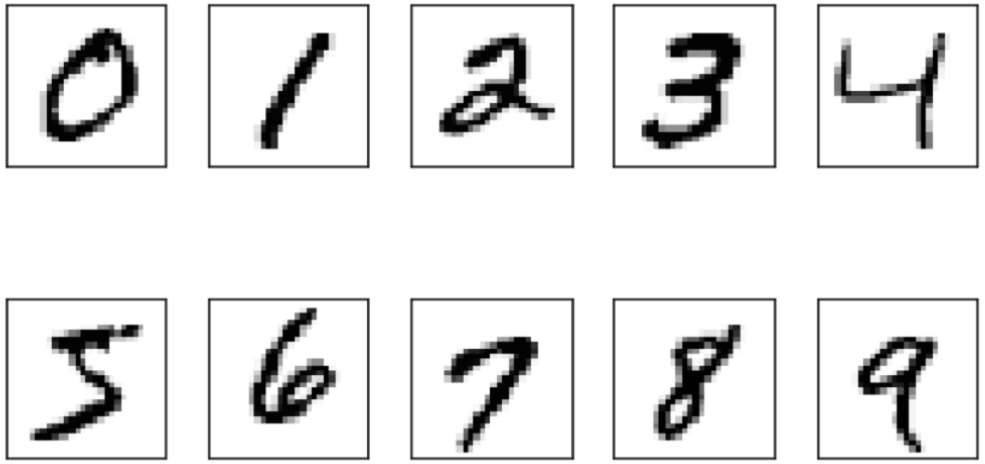
Example: MNIST Image Dataset



Balanced dataset:

- 10 classes (digits 0-9)
- 6k digits per class

Image dimensions: 28x28x1

In NCHW, an image batch of 128 examples would be a tensor with dimensions (128, 1, 28, 28)

- **Training set images**: train-images-idx3-ubyte.gz (9.9 MB, 47 MB unzipped, and 60,000 examples)
- **Training set labels**: train-labels-idx1-ubyte.gz (29 KB, 60 KB unzipped, and 60,000 labels)
- **Test set images**: t10k-images-idx3-ubyte.gz (1.6 MB, 7.8 MB, unzipped and 10,000 examples)
- **Test set labels**: t10k-labels-idx1-ubyte.gz (5 KB, 10 KB unzipped, and 10,000 labels)

Example: MNIST Image Dataset

```
Image batch dimensions: torch.Size([128, 1, 28, 28])
```

"NCHW" representation

```
Image label dimensions: torch.Size([128])
```

```
print(images[0].size())
```

```
torch.Size([1, 28, 28])
```

```
images[0]
```

```
tensor([[[0.0000, 0.0000, 0.0000, 0.0000, 0.0000, 0.0000, 0.0000, 0.0000,

```

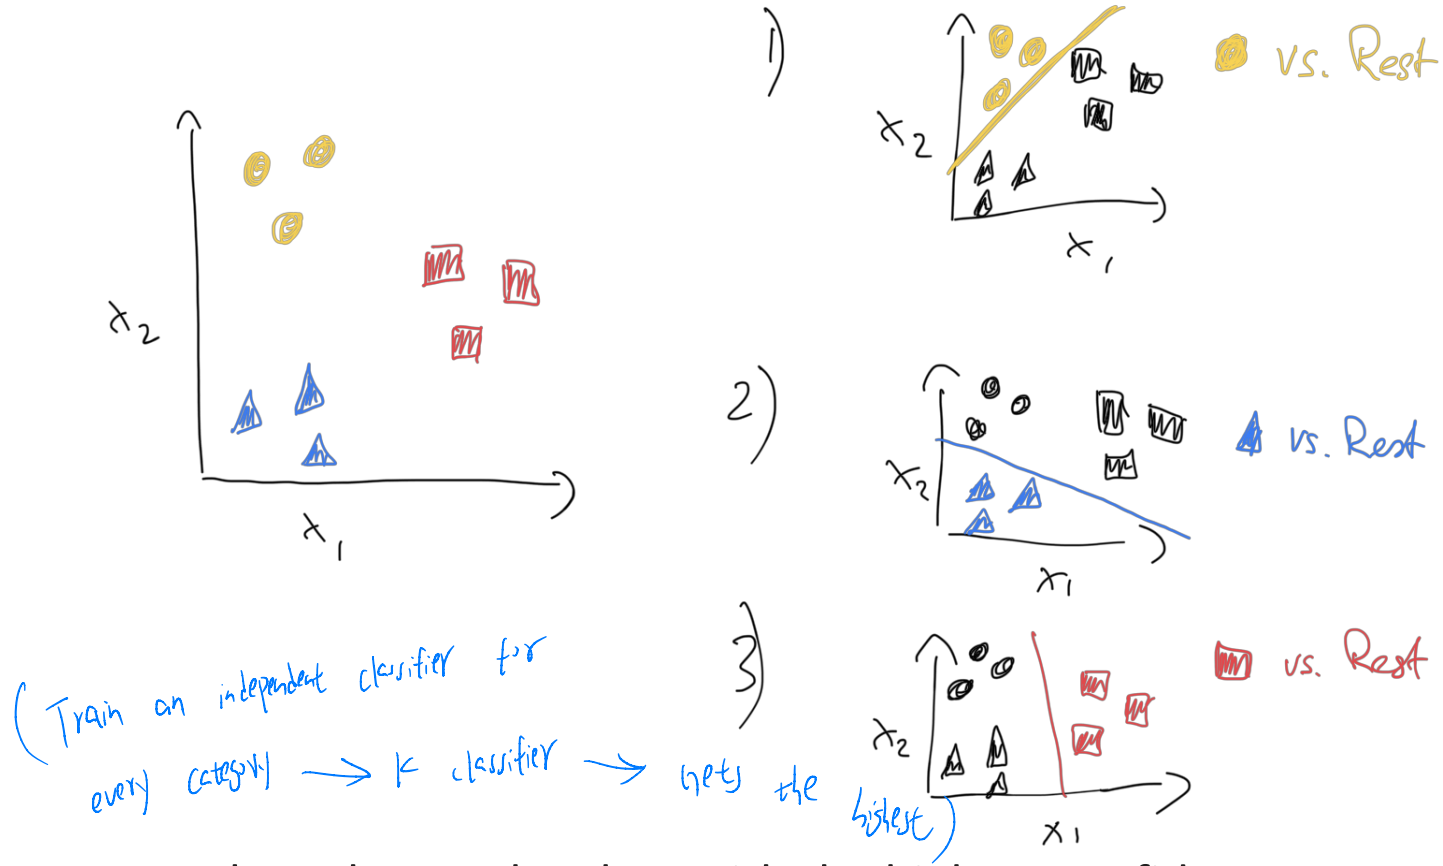
Note that I normalized pixels by factor 1/255 here

One approach to multi-class classification

One-vs-all

Predict each class label independently…

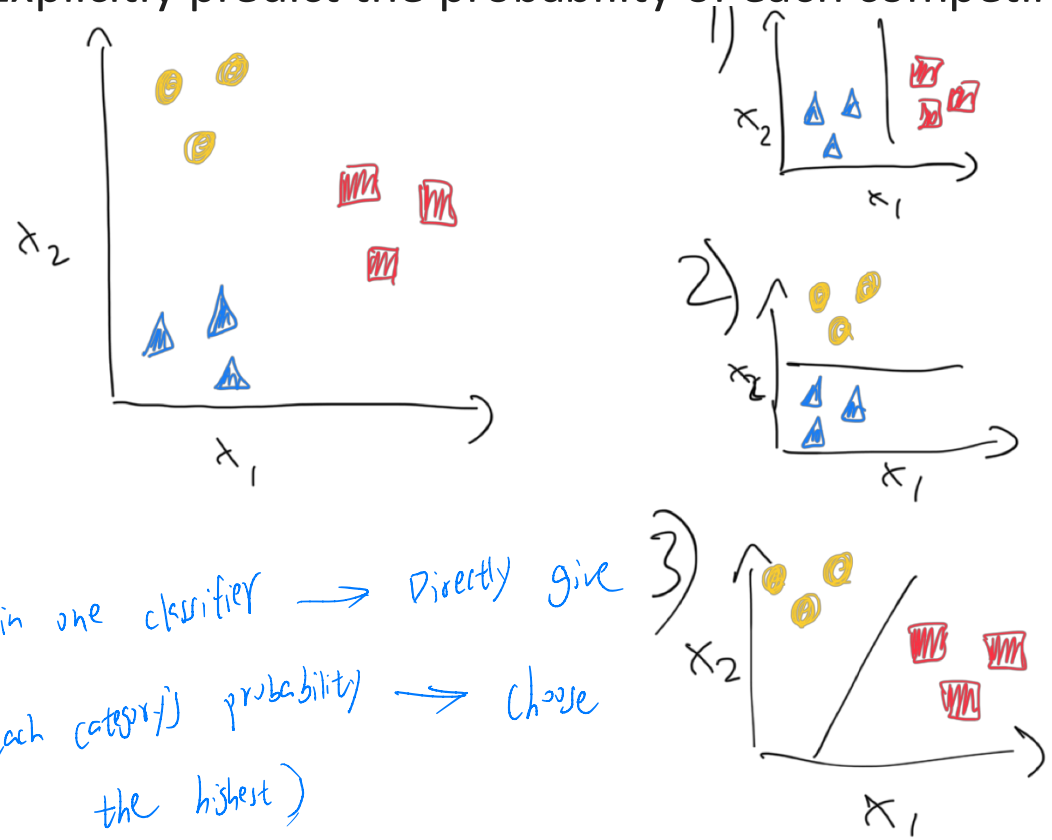


…Then choose the class with the highest confidence score

One approach to multi-class classification

All-vs-all

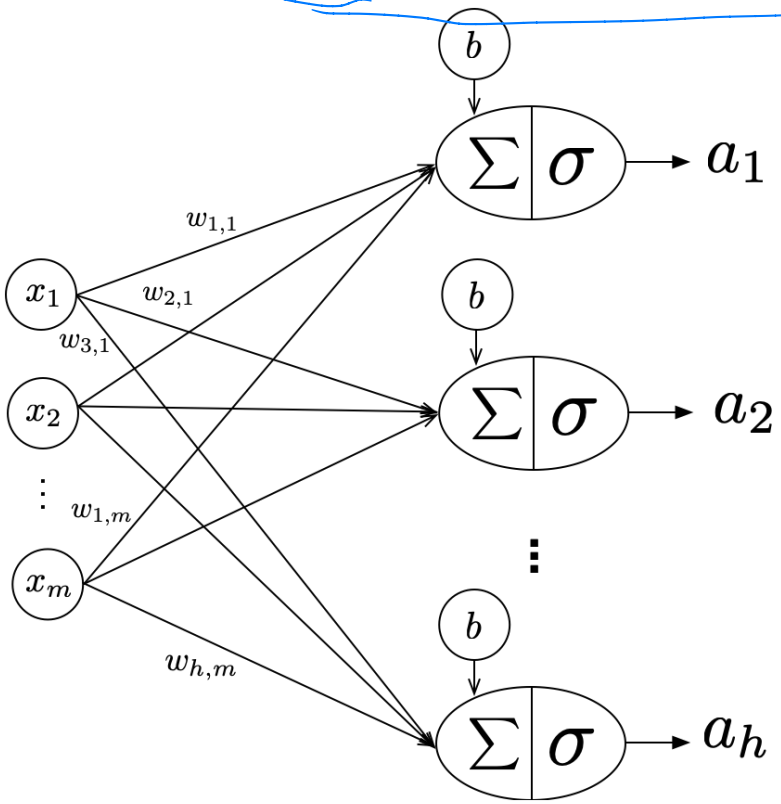
Explicitly predict the probability of each competing outcome…



…Then choose the class with the highest confidence score

Another approach

Predict probabilities of class membership simultaneously



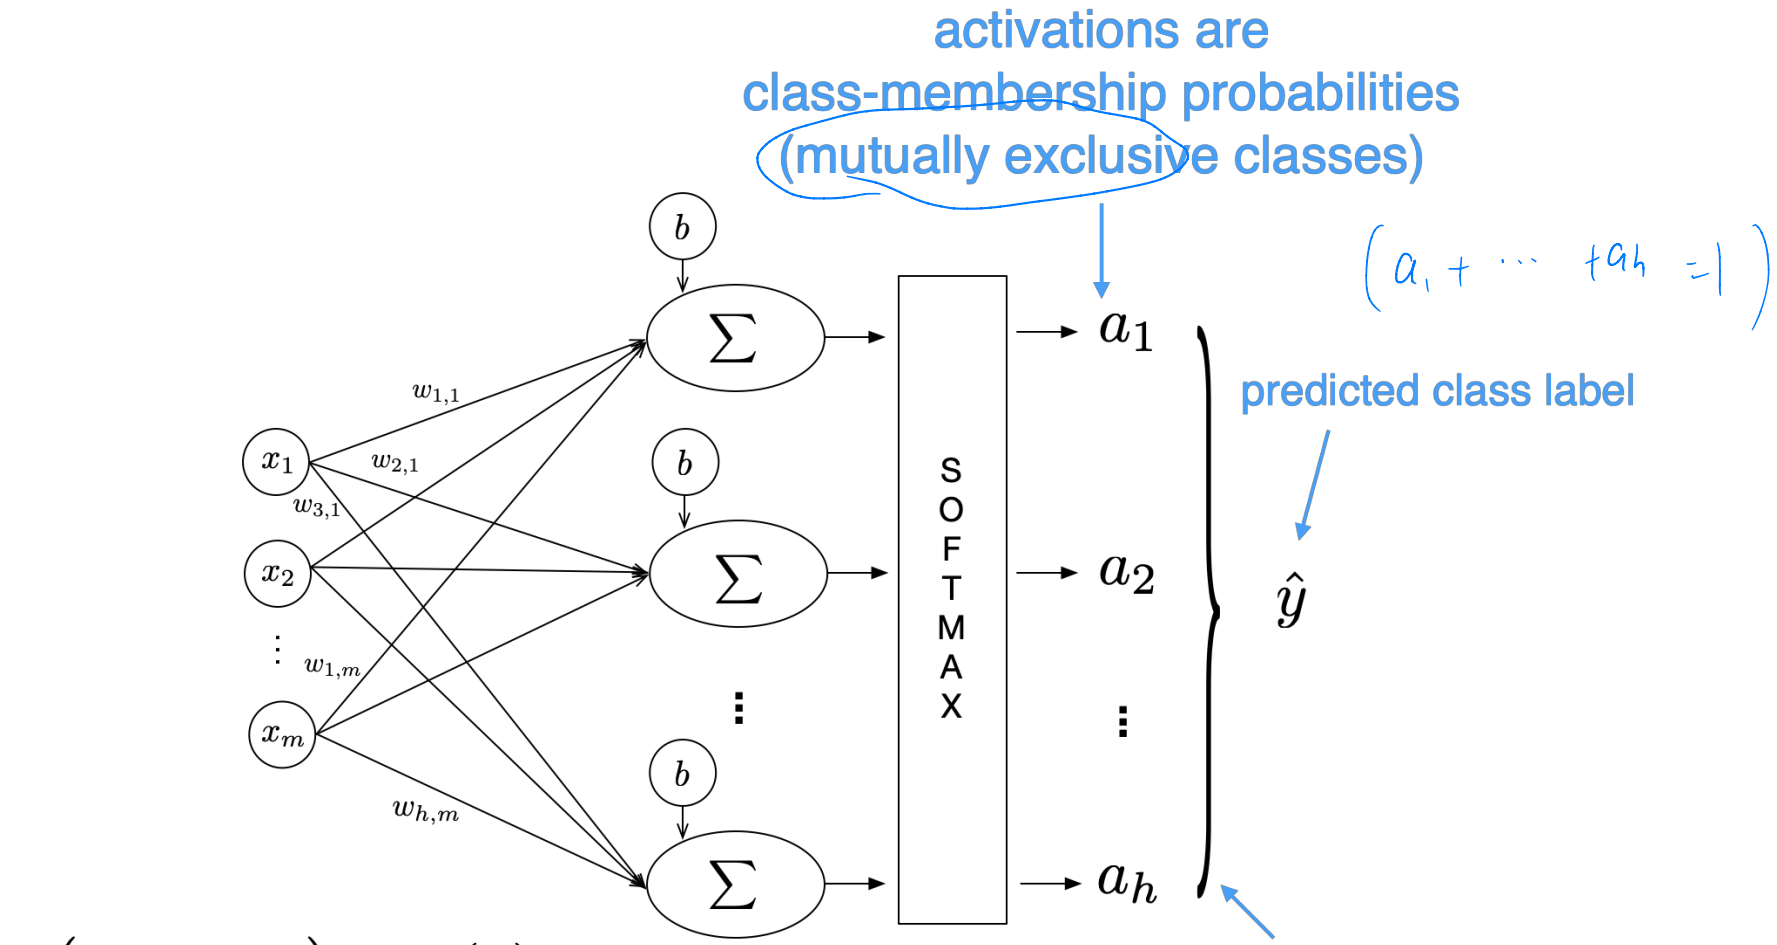
activations are class-membership probabilities (NOT mutually exclusive classes)

$$\sigma(\mathbf{W}\mathbf{x} + \mathbf{b}) = \sigma(\mathbf{z}) = \mathbf{a}$$

$$\mathbf{W} \in \mathbb{R}^{h \times m}$$

where *h* is the number of classes

Multinomial ("Softmax") Logistic Regression

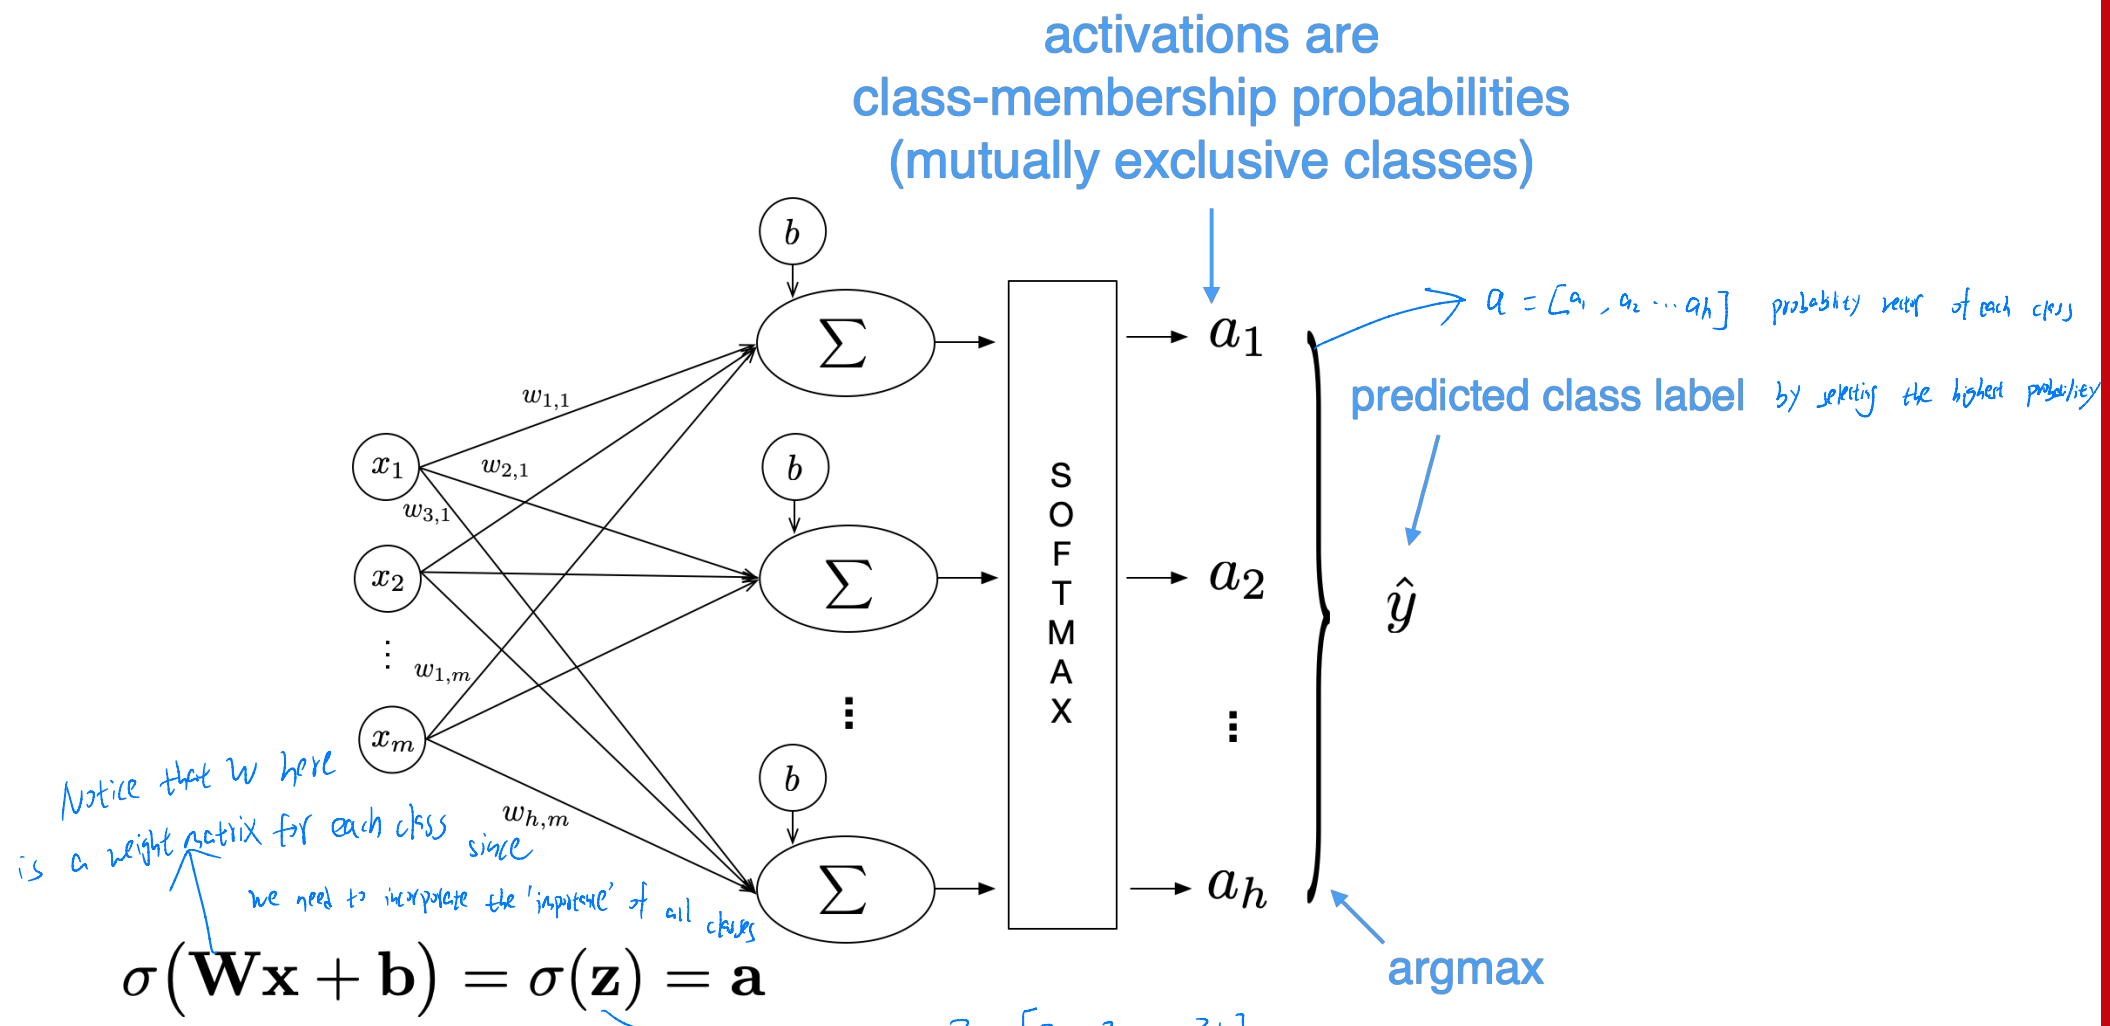


$$\sigma(\mathbf{W}\mathbf{x} + \mathbf{b}) = \sigma(\mathbf{z}) = \mathbf{a}$$

Today: Our old friend logistic regression…

1. Logistic regression as an artificial neuron
2. Negative log-likelihood loss
3. Logistic Regression Learning Rule
4. Logits and Cross-Entropy
5. Logistic Regression Code Example
6. Generalizing to Multiple Classes: Softmax Regression
7. **One-Hot Encoding and Multi-category Cross-Entropy**
8. Softmax Regression Learning Rule
9. Softmax Regression Code Example

Multinomial ("Softmax") Logistic Regression



“Softmax”

The category we care

The performance of i's sample on category t

$$P(y = t \mid z_t^{[i]}) = \sigma_{\text{softmax}}(z_t^{[i]}) = \frac{e^{z_t^{[i]}}}{\sum_{j=1}^{h} e^{z_j^{[i]}}}$$

Total scores

$$t \in \{j \ldots h\}$$

h is the number of class labels

A “soft” (differentiable) version of ”max”

Requires one-hot encoding

All category are equal in math ☆

class labels
0
1
3
2

→

class_0	class_1	class_2	class_3
1	0	0	0
0	1	0	0
0	0	0	1
0	0	1	0

(The model may mistakenly treat 2 is better than 1)

Loss Function (assuming one-hot encoding)

(Multi-category) Cross Entropy

for h different class labels

$$\mathcal{L} = \sum_{i=1}^{n} \sum_{j=1}^{h} -y_j^{[i]} \log\left(a_j^{[i]}\right)$$

Sum-loss function

Loss Function (assuming one-hot encoding)

$$\mathcal{L}_{\text{binary}} = -\sum_{i=1}^{n} \left(y^{[i]} \log(a^{[i]}) + (1 - y^{[i]}) \log(1 - a^{[i]}) \right)$$

This assumes one-hot encoded labels!

$$\mathcal{L} = \sum_{i=1}^{n} \sum_{j=1}^{h} -y_j^{[i]} \log \left(a_j^{[i]} \right)$$

for *h* different class labels

(Multi-category) Cross Entropy

Cross Entropy Example

$$\mathbf{Y}_{\text{onehot}} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \qquad \mathbf{A}_{\text{softmax outputs}} = \begin{bmatrix} 0.3792 & 0.3104 & 0.3104 \\ 0.3072 & 0.4147 & 0.2780 \\ 0.4263 & 0.2248 & 0.3490 \\ 0.2668 & 0.2978 & 0.4354 \end{bmatrix}$$

eg. The model has high confidence in class 1 (0.3792)

(4 training examples, 3 classes)

(The predicting matrix by the model)

Cross Entropy Example

1 training example

$$\mathbf{Y}_{\text{onehot}} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \qquad \mathbf{A}_{\text{softmax outputs}} = \begin{bmatrix} 0.3792 & 0.3104 & 0.3104 \\ 0.3072 & 0.4147 & 0.2780 \\ 0.4263 & 0.2248 & 0.3490 \\ 0.2668 & 0.2978 & 0.4354 \end{bmatrix}$$

(4 training examples, 3 classes)

$$\mathcal{L} = \sum_{i=1}^{n} \sum_{j=1}^{h} -y_j^{[i]} \log\left(a_j^{[i]}\right)$$

$$\begin{aligned} \mathcal{L}^{[1]} &= [(-1) \cdot \log(0.3792)] \\ &+ [(-0) \cdot \log(0.3104)] \\ &+ [(-0) \cdot \log(0.3104)] \\ &= 0.969692... \end{aligned}$$

Cross Entropy Example

$$\mathbf{Y}_{\text{onehot}} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \quad \mathbf{A}_{\text{softmax outputs}} = \begin{bmatrix} 0.3792 & 0.3104 & 0.3104 \\ 0.3072 & 0.4147 & 0.2780 \\ 0.4263 & 0.2248 & 0.3490 \\ 0.2668 & 0.2978 & 0.4354 \end{bmatrix}$$

$$\begin{aligned} \mathcal{L}^{[1]} &= [(-1) \cdot \log(0.3792)] \\ &+ [(-0) \cdot \log(0.3104)] \\ &+ [(-0) \cdot \log(0.3104)] \\ &= 0.969692... \end{aligned}$$

$$\begin{aligned} \mathcal{L}^{[2]} &= [(-0) \cdot \log(0.3072)] \\ &+ [(-1) \cdot \log(0.4147)] \\ &+ [(-0) \cdot \log(0.2780)] \\ &= 0.880200... \end{aligned}$$

$$\begin{aligned} \mathcal{L}^{[3]} &= [(-0) \cdot \log(0.4263)] \\ &+ [(-0) \cdot \log(0.2248)] \\ &+ [(-1) \cdot \log(0.3490)] \\ &= 1.05268... \end{aligned}$$

$$\begin{aligned} \mathcal{L}^{[4]} &= [(-0) \cdot \log(0.2668)] \\ &+ [(-0) \cdot \log(0.2978)] \\ &+ [(-1) \cdot \log(0.4354)] \\ &= 0.831490... \end{aligned}$$

$$\mathcal{L} = \frac{1}{n} \sum_{i=1}^{n} \sum_{j=1}^{h} -y_j^{[i]} \log\left(a_j^{[i]}\right)$$

$$\approx 0.9335$$

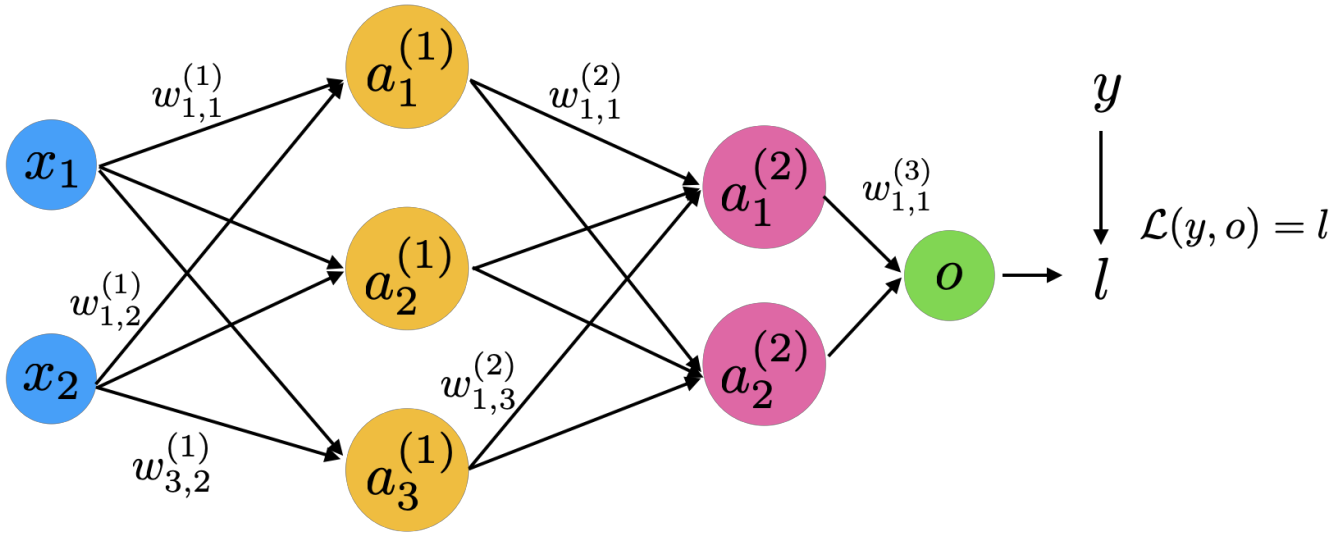
The Same Overall Concept Applies…

Want: $\frac{\partial \mathcal{L}}{\partial w_i}$ and $\frac{\partial \mathcal{L}}{\partial b}$

$$\frac{\partial \mathcal{L}}{\partial w_i} = \frac{\partial \mathcal{L}}{\partial a}\frac{da}{dz}\frac{\partial z}{\partial w_i}$$

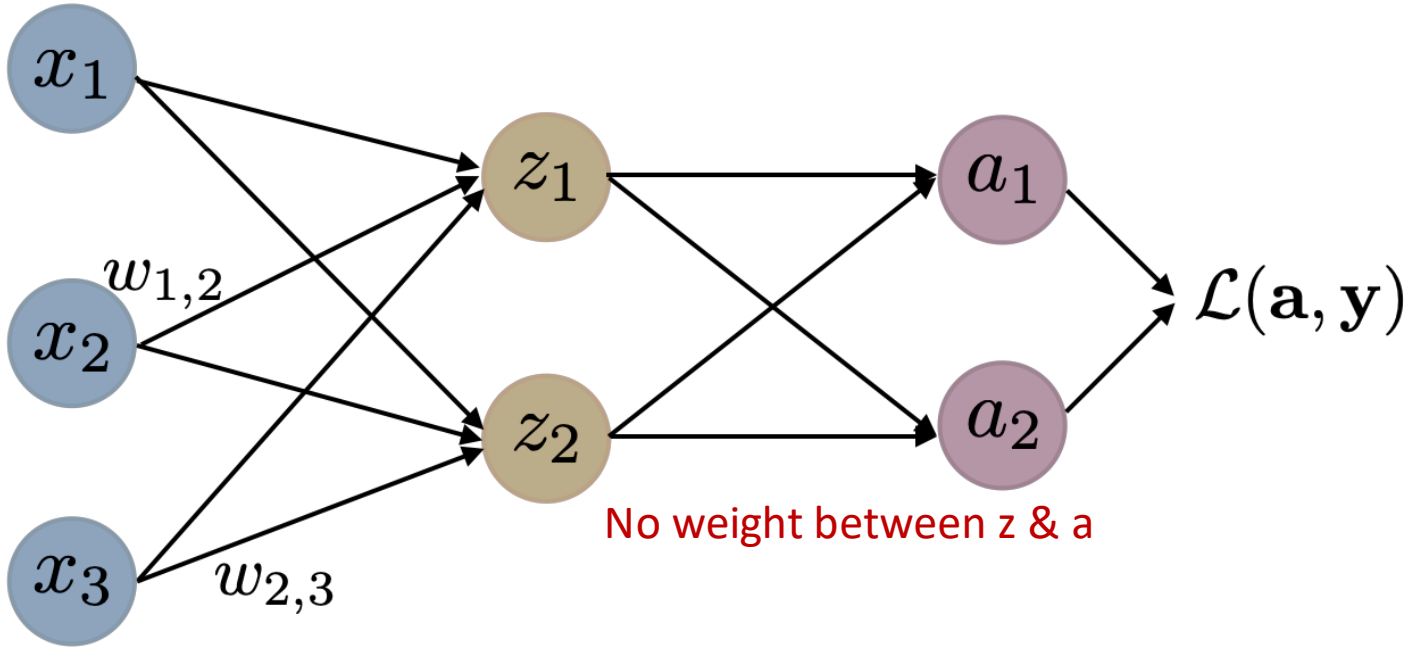
$$\frac{\partial \mathcal{L}}{\partial b} = \frac{\partial \mathcal{L}}{\partial a}\frac{da}{dz}\frac{\partial z}{\partial b}$$



$$\frac{\partial l}{\partial w_{1,1}^{(1)}} = \frac{\partial l}{\partial o}\cdot\frac{\partial o}{\partial a_1^{(2)}}\cdot\frac{\partial a_1^{(2)}}{\partial a_1^{(1)}}\cdot\frac{\partial a_1^{(1)}}{\partial w_{1,1}^{(1)}} + \frac{\partial l}{\partial o}\cdot\frac{\partial o}{\partial a_2^{(2)}}\cdot\frac{\partial a_2^{(2)}}{\partial a_1^{(1)}}\cdot\frac{\partial a_1^{(1)}}{\partial w_{1,1}^{(1)}}$$

Multivariable chain rule :)

Softmax Regression Sketch



No weight between z & a

Multivariable chain rule

$$\frac{\partial L}{\partial w_{1,2}} = \frac{\partial L}{\partial a_1}\frac{\partial a_1}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}} + \frac{\partial L}{\partial a_2}\frac{\partial a_2}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}}$$

$$-\frac{y_1}{a_1} \quad a_1(1-a_1) \quad x_2 \qquad -\frac{y_2}{a_2} \quad -a_2 a_1 \quad x_2$$

Softmax Regression Derivation

$$\frac{\partial L}{\partial w_{1,2}} = \frac{\partial L}{\partial a_1}\frac{\partial a_1}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}} + \frac{\partial L}{\partial a_2}\frac{\partial a_2}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}}$$

$$-\frac{y_1}{a_1}$$

$$\frac{\partial L}{\partial a_1} = \frac{\partial}{\partial a_1}\left[\sum_{j=1}^{h} -y_j \log(a_j)\right]$$

$$= \frac{\partial}{\partial a_1}\left[-y_1 \log(a_1)\right]$$

$$= -\frac{y_1}{a_1}$$

Softmax Regression Derivation

$$\frac{\partial L}{\partial w_{1,2}} = \frac{\partial L}{\partial a_1}\frac{\partial a_1}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}} + \frac{\partial L}{\partial a_2}\frac{\partial a_2}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}}$$

$$\frac{\partial a_1}{\partial z_1} \rightarrow a_1(1-a_1)$$

$$\frac{\partial a_1}{\partial z_1} = \frac{\partial}{\partial z_1}\left[\frac{e^{z_1}}{\sum_{j=1}^{h} e^{z_j}}\right]$$

	Function	Derivative
Sum Rule	$f(x)+g(x)$	$f'(x)+g'(x)$
Difference Rule	$f(x)-g(x)$	$f'(x)-g'(x)$
Product Rule	$f(x)g(x)$	$f'(x)g(x)+f(x)g'(x)$
Quotient Rule	$f(x)/g(x)$	$[g(x)f'(x)-f(x)g'(x)]/[g(x)]^2$
Reciprocal Rule	$1/f(x)$	$-[f'(x)]/[f(x)]^2$
Chain Rule	$f(g(x))$	$f'(g(x))g'(x)$

$$= \frac{\left[\sum_{j=1}^{h} e^{z_j}\right]\frac{\partial}{\partial z_1}e^{z_1} - e^{z_1}\frac{\partial}{\partial z_1}\left[\sum_{j=1}^{h} e^{z_j}\right]}{\left[\sum_{j=1}^{h} e^{z_j}\right]^2}$$

$$= \frac{\left[\sum_{j=1}^{h} e^{z_j}\right]e^{z_1} - e^{z_1}e^{z_1}}{\left[\sum_{j=1}^{h} e^{z_j}\right]^2}$$

$$= \frac{e^{z_1}\left(\left[\sum_{j=1}^{h} e^{z_1}\right] - e^{z_1}\right)}{\left[\sum_{j=1}^{h} e^{z_j}\right]^2} = \frac{e^{z_1}}{\left[\sum_{j=1}^{h} e^{z_j}\right]} \cdot \frac{\left[\sum_{j=1}^{h} e^{z_j}\right] - e^{z_1}}{\left[\sum_{j=1}^{h} e^{z_j}\right]} = a_1(1-a_1)$$

Softmax Regression Derivation

$$\frac{\partial L}{\partial w_{1,2}} = \frac{\partial L}{\partial a_1}\frac{\partial a_1}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}} + \frac{\partial L}{\partial a_2}\frac{\partial a_2}{\partial z_1}\frac{\partial z_1}{\partial w_{1,2}}$$

$$\frac{\partial a_2}{\partial z_1} \rightarrow -a_2 a_1$$

$$\frac{\partial a_2}{\partial z_1} = \frac{\partial}{\partial z_1}\left[\frac{e^{z_2}}{\sum_{j=1}^{h} e^{z_j}}\right]$$

	Function	Derivative
